EXP NO:10 Experiment to understand array function in Data science.

AIM:
To understand the array function using the NumPy library.

PROGRAM:

python

```
import numpy as np

# Creating an array of student marks
array = np.array([78, 65, 92, 55, 88, 73, 96, 61, 84])
array

# Finding square root
np.sqrt(array)

# Finding number of dimensions
array.ndim

# Reshaping into 3x3
new_array = array.reshape(3, 3)
new_array

# Finding dimensions
new_array.ndim

# Converting into 1D array
new_array.ravel()

# Reshaping again
newm = new_array.reshape(3, 3)
newm

# Selecting elements from third row
newm[2, 1:3]

# Selecting elements from second row
newm[1:2, 1:3]

# Selecting first column
new_array[0:3, 0:1]

# Selecting first two columns
new_array[0:3, 0:2]

# Selecting rows 1 and 2
new_array[1:3]
```

OUTPUT:

```
array([[55, 88, 73],

       [96, 61, 84]])
```

RESULT:
Thus the program to understand the array function using the NumPy library was executed successfully.
